Education

Indian Institute of Technology, Delhi
BTech in Computer Science and Engineering

July 2018 – Apr 2022

Experience

Senior AI Engineer
Javis Technologies

Bangalore, IN
Nov 2025 – Present

- Developed a real-time voice AI agent (Python, LiveKit) that handles live customer calls in English and Hindi. Integrated streaming speech-to-text/text-to-speech with Silero voice-activity detection and semantic turn-detection to enable natural, low-latency conversations with barge-in, driving each call through a config-driven conversation engine with LLM-assisted intent classification and tool-calling.
- Designed and deployed the SIP telephony stack behind it, routing calls through OpenSIPS (a TLS SIP proxy) into FreeSWITCH for media handling, codec transcoding, and SRTP encryption before bridging into LiveKit. Added a FastAPI authentication and anti-fraud gateway with Redis-backed rate-limiting and phone-to-tenant identity resolution.
- Designing a context-memory layer for the agentic AI platform that keeps a structured, deterministic record of each multi-turn conversation across channels. It resolves references and disambiguates intent across turns so the agent can act on prior context, and seeds a long-term memory of customer interactions.

Software Engineer → Senior Software Engineer
Enphase Energy

Bangalore, IN
July 2022 – Nov 2025

- Designed and developed a Translation Management System to centrally manage internationalization (i18n) across a suite of microservices / microfrontends, and deliver translations to services dynamically. This eliminated dependency on code changes for text updates, and gave direct control to PMs to manage text in our applications.
- Enhanced search functionality for core Data entity by 95% by introducing a denormalized Elasticsearch index, effectively resolving data fragmentation across RDS and MongoDB. Employed Kafka and Logstash for seamless data synchronization with Elasticsearch to ensure real-time indexing.

Open Source Contributions

Ruby on Rails - Web Framework for the Ruby Language

github.com 

- Corrected default configs for greenfield rails apps created using the rails cli.

Solo Startup (Shutdown)

ShortsKing - Content Automation Platform

archive.org 

- Developed and launched a fully automated short video content creation platform requiring minimal user input (title, visual style, voice), **organically attracting over 1000 real users**.
- Independently managed the complete lifecycle of the Ruby on Rails full-stack application, including design, development (frontend/backend), deployment, integrations, and marketing, leveraging open-source LLMs and ffmpeg for content generation and processing.

Technical Skills

Languages: Ruby, Python, Java, Javascript, C++, SQL, KQL, HTML, CSS

Frameworks/Tools: FastAPI, Ruby on Rails (RoR), Airflow, Kafka, Springboot, Docker, ELK Stack, LiveKit, WebRTC, SIP, FreeSWITCH, OpenSIPS, Redis

Cloud: AWS (S3, SQS, MSK, CloudWatch, CloudFront, ECR), Cloudflare (DNS, Workers AI, R2, CDN)
